Intraday Strategies from the Rani Trading Docs, and Gap Analysis of VwapScanner.Android

Prepared 9 November 2026. Sources: the three Hindi PDFs in `RaniTradingDocs` (translated to English here) and the code in `VwapScanner.Android`.

1. Scope and reading notes

Item	Detail
Documents	(A) *Zero to Trader 30 Days* (36 pp), (B) *Zero to Trader Complete Trading Guide, Hindi, 2026 edition* (201 pp, Satu Stock Learner), (C) *Candlestick Mastery Blueprint* (67 pp, Satu E-Book Store)
Format	All three are scanned page images with no text layer, so I read them visually and translated. Page numbers below are the printed page numbers.
Read in full	(A) all pages. (B) chapters 10-20 and 22 (breakout/retest, volume, supply zone, liquidity sweep, chart patterns, indicators incl. VWAP, BOS/CHoCH, SMC, entry/exit, risk, strategies, journal/backtesting/paper trading/trading plan).
Read in part	(B) chapters 1-9 and 21 (market basics, S/R, trend, psychology) were skimmed only; (A) covers the same ground. (C) contents page plus sample chapters (Hammer, Morning/Evening Star, Spinning Top, Shooting Star, Dark Cloud Cover, Bearish Kicker). The other pattern chapters follow the same template (what it is, how to spot it, entry / stop / target, mistakes to avoid).
App	Strategy, exit evaluator, portfolio optimizer, scanner, settings definitions, coordinator and Kite client read directly; the remaining files (UI pages, Android services) were searched by keyword for features such as RSI, short selling, order placement and daily limits.
Nature of the docs	Beginner education material. They give conventions (RSI 30/70, EMA 9/21, 1:2 reward-risk) and say themselves that nothing guarantees profit. They contain no tested statistics. Everything in section 3 is a candidate to backtest, not a proven edge.

2. What the three documents teach

Doc	Content that matters for intraday	Pages
A. 30 Days	Day-by-day plan: candlesticks, support/resistance, market structure (HH/HL/LH/LL), breakout and fake breakout, trendline, demand/supply, multi-timeframe, RSI, EMA 9/21, combo strategy, entry setup, stop loss, risk, backtesting, psychology, over-trading, paper trading, first trade, final system.	6-35
B. Complete Guide	VWAP (what it is, as support/resistance, practical checklist, full example); breakout / breakdown / retest; price-volume analysis; liquidity and liquidity sweep; chart patterns; MA, RSI, MACD; BOS / CHoCH; SMC (order block, FVG, displacement, mitigation); entry, exit, target, stop loss; position sizing; scalping vs intraday vs swing; journal, backtesting, paper trading, trading plan.	70-81, 86-99, 100-137, 139-173, 180-199
C. Candlestick Blueprint	30 candlestick patterns, each with the same trade template: wait for a confirmation candle, stop beyond the pattern, target at the next level or 1:2 to 1:3. Time frame guide: scalping 1M-5M, intraday 5M-15M, swing 1H-daily.	3-67

Rules that every document repeats, whatever the strategy:

#	Universal rule	Where
1	Risk at most 1-2% of capital per trade.	A Day 3, Day 20; B p.147-153
2	Position size = maximum risk / (entry minus stop).	A Day 19-20; B p.148, 153
3	Every trade has a stop loss, placed where the trade idea is proven wrong, not at an arbitrary rupee distance. Never remove or widen it.	A Day 19, Day 27; B p.142-144
4	Minimum reward-risk of 1:2.	A Day 17-20; B p.143, 146
5	Trade with the trend. Higher time frame gives direction, lower time frame gives entry (example: 1H trend, 15M entry).	A Day 8, Day 13; B p.172
6	Never enter on one signal. Wait for confirmation (confirmation candle, volume, level).	A Day 17-18, Day 30 extra; B p.73-81, 128
7	Quality over quantity: about 1-3 good setups a day, no revenge trading, a daily loss limit (the guide's example is 2% of capital).	A Day 23-24; B p.178-179
8	Book profit by plan: part at the first target, trail the rest.	A Day 25
9	Journal every trade, review weekly, backtest the rules (the guide warns that 5-10 trades prove nothing), then paper trade before real money.	A Day 21, 28; B p.180-199

3. Intraday strategies extracted from the documents

"Basis" says whether the rule is explicit in the docs or whether I filled in parameters. For VWAP the docs describe how to read the line and give a checklist, but they do not give VWAP-specific stop or target rules. There, the general rules from the table above apply and the stop placement in S1 and S2 is my suggestion.

#	Strategy	Direction	Setup and entry trigger	Stop loss	Target	Best time frame	Basis	Source
S1	**VWAP trend pullback (bounce)**	Long	Price above VWAP and making HH/HL. Price pulls back to the VWAP area, buyers react there (bullish candle), volume at or above normal. Enter above the confirmation candle's high.	Below the pullback low or just below VWAP (suggested)	Next resistance or prior high; at least 1:2	5M-15M	Docs principle + suggested stop	B p.118-120
S2	**VWAP rejection**	Short	Price below VWAP making LH/LL. Price rallies up to VWAP, sellers reject it (bearish candle). Enter below the confirmation candle's low.	Above the rejection high or just above VWAP (suggested)	Next support or prior low; at least 1:2	5M-15M	Docs principle + suggested stop	B p.118-120
S3	**VWAP mean reversion** (what the app does)	Long	Close at least 1 ATR below VWAP, candle closes up in the upper half of	1 ATR below entry	1.5 x risk	1M	App design, not a docs strategy. Nearest docs idea: oversold at	`VwapStrategy.cs`

#	Strategy	Direction	Setup and entry trigger	Stop loss	Target	Best time frame	Basis	Source
			its range, volume at or above the 20-bar average, bar turnover at least INR 5 lakh.				a level plus confirmation (A Day 15, 17). The docs also warn that price below VWAP with LH/LL signals weakness (B p.119).	
S4	**Breakout (or breakdown) and retest**	Both	A level touched several times. A strong candle closes beyond it on higher volume. Price returns to the level, holds, and a confirmation appears: enter there.	Beyond the level that was broken (guide example: entry 505, stop 485)	Next level; the guide example is 545 for 1:2	5M-15M	Docs explicit	A Day 9-10; B p.70-75, 146
S5	**False breakout / liquidity sweep reversal**	Both	Price takes out a prior high or low, then closes back inside the range, then structure changes (lower high	Beyond the sweep extreme	Opposite side of the range or next level	5M-15M	Docs explicit (checklist of 4 steps)	A Day 10; B p.87-93

#	Strategy	Direction	Setup and entry trigger	Stop loss	Target	Best time frame	Basis	Source
			after a sweep up, higher low after a sweep down). Do not buy the spike.					
S6	**Support/Resistance + RSI + EMA 9/21 combo** (the guide's signature setup)	Both	Long: price at support, RSI(14) at or under 30 and turning up, price above the 9 EMA with 9 crossing above 21, bullish candle. Short is the mirror at resistance with RSI above 70. All conditions together; the more present, the higher the probability.	Below support / swing low (above resistance for shorts)	Next opposite level; reward-risk 1:2 or better	Intraday 15M; swing 1H-4H	Docs explicit	A Day 15-18, p.22-23
S7	**Demand/supply zone with multi-timeframe**	Both	1H chart gives the trend (uptrend means buy only). Mark the demand (or supply)	Outside the zone	Next zone or level	1H trend, 15M entry	Docs explicit	A Day 12-13; B p.82-86

#	Strategy	Direction	Setup and entry trigger	Stop loss	Target	Best time frame	Basis	Source
			zone on 15M. Enter when a confirmation candle forms inside the zone.					
S8	**Candlestick reversal at a level**	Both	A reversal pattern (Hammer, Inverted Hammer, Morning Star, Engulfing, Piercing, Tweezer, Pin Bar, Kicker; mirror patterns for shorts) at support or resistance, after a trend, ideally on high volume. Wait for the next candle to confirm, then enter above its high (long) or below its low (short). Skip in sideways markets.	Beyond the pattern's low (long) or high (short)	Next level, or 1:2 to 1:3	5M-15M	Docs explicit	C p.6-67

#	Strategy	Direction	Setup and entry trigger	Stop loss	Target	Best time frame	Basis	Source
S9	**Smart-money sequence (SMC)**	Both	Liquidity sweep, then CHoCH / BOS, then a strong displacement move, then price returns to the order block or fair value gap, then a reaction. Enter on the retest reaction. The author states this is a framework, not a fixed rule.	Beyond the order block / sweep	Prior swing or next liquidity pool	5M-15M	Docs explicit but subjective	B p.121-138
S10	**Chart-pattern breakout**	Both	Flag or pennant after a strong move, ascending / descending / symmetrical triangle, double top / bottom, head and shoulders. Check where the pattern formed, the trend, nearby S/R,	Beyond the pattern	Pattern height or next level	5M-15M	Docs explicit	B p.94-99

#	Strategy	Direction	Setup and entry trigger	Stop loss	Target	Best time frame	Basis	Source
			whether the break happened, and volume.					
S11	**RSI divergence and MACD momentum**	Filters	Price makes a new high while RSI makes a lower high (bearish divergence), or the reverse. MACD line / signal crossover and histogram growth confirm momentum. Never traded alone.	n/a	n/a	any	Docs explicit	B p.105-115
S12	**Scalping**	Both	Short-lived moves on 1M-5M charts, tight but logical stop, liquid stocks, fast execution. The docs list the risks: over-trading, charges, false signals, emotional	Tight	Small	1M-5M	Docs principle only	B p.164-165

#	Strategy	Direction	Setup and entry trigger	Stop loss	Target	Best time frame	Basis	Source
			pressure. No specific setup is given.					

The VWAP practical checklist from the guide (p.119), which S1 to S3 should all pass:

Question	S1 / S2 expectation
Is price above or below VWAP?	Above for longs, below for shorts
What is the trend?	With the trade direction
What is the market structure?	HH/HL for longs, LH/LL for shorts
How is volume?	Above normal on the reaction candle
Where are support and resistance?	Room to the next level of at least 2x the risk

4. What the app does today

Area	Current behaviour (from code)
Strategy	One strategy only, long only: VWAP mean reversion (S3). Signals come from 1-minute candles. Indicators: session VWAP (high+low+close)/3 weighted by volume, EMA 5/13, ATR 10, 3-bar momentum, relative volume vs the prior 20 bars.
Entry conditions	Close at least 1.0 ATR below VWAP; close above the previous close and in the upper half of its own range; relative volume at least 1.0; bar turnover at least INR 5 lakh; target distance at least 15 bps; decision time between 09:30 and 15:00.
Market filter	A signal is skipped when NIFTY 50 is in a 1-minute downtrend (EMA5 below EMA13 and 3-bar momentum negative). The same downtrend test exists for individual stocks but is only applied to NIFTY.
Stop / target	Stop 1 ATR below the signal close; target 1.5 x that distance (reward-risk 1.5).
Sizing	Risk per trade 0.15% of capital, portfolio stop risk 0.45%, up to 3 positions, 25% per stock, 1% of the signal bar's volume, Zerodha fee model and 5 bps slippage per side. Risk budget split by score.
Exits	Exit Monitor every 15 s on live 1-minute candles: target, stop, close-out at 15:15; Reversal Guard (arms at 50% of the way to target, then breakeven stop, 40% give-back, 3 lower closes below VWAP, or falling trend projection); Stop Reprieve (waits up to 15 min after a stop touch if price is back above it and VWAP is at least one stop-distance above).
Execution	Read-only. It never places orders. Notifications, grids, CSV export, daily reminder.
Process	Today's rows saved in `history.json`; two CSV files at the close; replay of a past date/time via `Scan:Date` and `Scan:At`.
Universe	NIFTY 50 / 100 / 200 / 500 lists (default NIFTY 100).

5. Gap analysis

Status key: **Covered**, **Partial**, **Missing**, **By design**. Priority: H, M, L (my judgment of value against effort, explained in section 7).

5.1 Signals and strategies

#	Capability in the docs	App today	Status	Priority
1	Session VWAP line	Computed from 1-minute candles	Covered	-
2	VWAP mean reversion (S3)	Implemented (it is the whole app)	Covered (not in docs)	-
3	VWAP trend pullback long (S1)	Not present	Missing	H
4	VWAP rejection short (S2)	Not present; the app is long only	Missing	H
5	VWAP checklist: price vs VWAP	Yes, measured as stretch in ATRs	Covered	-
6	VWAP checklist: trend	Index-level only (NIFTY 1-minute). The stock's own trend is not checked even though the code can compute it.	Partial	H
7	VWAP checklist: market structure (HH/HL, LH/LL)	No swing detection	Missing	M
8	VWAP checklist: volume	Relative volume and turnover filters	Covered (the default 1.0x only means "at least average")	-
9	VWAP checklist: support/resistance	No levels at all	Missing	H
10	Multi-timeframe (1H trend, 15M entry)	1-minute only for signal and exit; no higher-time-frame view	Missing	H
11	Support / resistance, prior-day high/low, trendlines	None	Missing	H
12	Demand / supply zones (S7)	None	Missing	M
13	Breakout / breakdown + retest (S4)	None	Missing	H
14	False breakout / liquidity sweep (S5)	None	Missing	M
15	EMA 9/21 trend and crossover (S6)	EMA 5/13 used internally, only for the NIFTY filter	Partial	M

#	Capability in the docs	App today	Status	Priority
16	RSI (S6, S11)	None	Missing	M
17	MACD (S11)	None	Missing	L
18	Candlestick patterns (S8)	Only a generic "closed up in the upper half" rule; no named patterns	Partial	M
19	Chart patterns (S10)	None	Missing	L
20	BOS / CHoCH / order block / FVG (S9)	None	Missing	L
21	Short side (all bearish setups)	Long only	Missing	M
22	Liquid-stock selection	Turnover filter, 1% volume participation cap, NIFTY lists; no bid-ask spread check	Partial	L
23	Trading window avoiding the open and close	09:30 to 15:00 entries, 15:15 close-out	Covered	-

5.2 Entry, exit and trade management

#	Capability in the docs	App today	Status	Priority
24	Enter after a confirmation candle	Buys at the close of the signal candle itself. That candle is a turn-up candle, but there is no further confirmation.	Partial	M
25	Stop at the level that invalidates the idea (support, swing low)	Fixed 1 ATR below entry (volatility-based, not structure-based)	Partial	M
26	Target at the next S/R, reward-risk at least 1:2	Fixed 1.5 x risk, with no level check	Partial. Default sits below the docs' 1:2 minimum.	H
27	Partial profit at target 1, trail the rest	All-or-nothing exit. The Reversal Guard (breakeven stop and fade exits) does part of this job.	Partial	M
28	Trailing stop	Stop moves to breakeven plus 5 bps once armed; it does not trail upward after that	Partial	M
29	Never remove or widen the stop	Stop Reprieve waits up to 15 minutes after a stop touch and sells on a later close at or below the stop. The exit can then fill below the planned stop, so the loss can exceed the planned risk.	Deviation from the docs. It is a deliberate design choice and needs data to justify it.	H
30	Square off before close	15:15 close-out, 15-second monitoring	Covered	-
31	Count charges and slippage	Zerodha fee model and 5 bps per side in sizing and net gain	Covered (ahead of docs)	-

5.3 Risk and discipline

#	Capability in the docs	App today	Status	Priority
32	Risk 1-2% per trade	0.15% per trade, 0.45% total	Covered (more conservative)	-
33	Position size = risk / per-share risk	Same formula, plus fees, slippage, allocation and volume caps	Covered (ahead of docs)	-
34	Limit the number of trades per day (1-3 quality trades)	Only a cap of 3 open positions. No setting limits trades per day, and money returned by an exit is free to buy again on later signals.	Missing	H
35	Daily loss limit, stop trading when hit	No such setting. Realised losses only shrink the free capital.	Missing	H
36	No revenge trading / cool-down after a loss	None	Missing	M
37	Pre-trade checklist (all answers yes)	The signal gate is an automated checklist of six conditions	Covered for technical items only	-

5.4 Process: journal, backtest, paper trade, review

#	Capability in the docs	App today	Status	Priority
38	Journal: entry, stop, target, exit, P&L, reason	Grids and CSV carry entry, stop, target, exit price, net gain, exit reason, peak. No place for the trader's own note, mistake or lesson.	Partial	L
39	Performance review: trades, wins, losses, average win/loss, repeat mistakes, weekly review	Totals bar shows invested amount and gross P&L only. No win rate, average win/loss, expectancy or drawdown, and `history.json` holds only the current day.	Missing	H
40	Backtesting over many trades, rules fixed	Single-day replay through `Scan:Date` / `Scan:At`. No multi-day run, no aggregate result.	Partial	H
41	Paper trading before real money	The app never places orders, so it is a paper trader in practice. It has no scorecard against the guide's graduation criteria (about 55% win rate, consistent profit over months).	Covered de facto; needs scoring	M
42	Daily routine (pre-market analysis, plan, review)	09:10 reminder notification; no pre-market checklist or end-of-day review	Partial	L
43	Placing the entry / stop / target orders	Not done	By design (read-only)	-

6. Where the app is ahead of the documents

Area	Detail
Cost realism	The docs mention slippage and charges only in words. The app models Zerodha intraday fees and slippage in sizing, net gain and the 15 bps minimum target.
Portfolio sizing	Risk budget split across several signals by score, with allocation and volume-participation caps. The docs size one trade at a time.
Live exit logic	A 15-second Exit Monitor that replays candles deterministically, so a restart gives the same answer. The docs describe exits only as plans.
Operations	Foreground service, daily reminder, notifications, CSV at close, restart recovery.

7. Recommended order of work

Effort is my estimate: S = a day or less, M = a few days, L = a week or more. "Where" names the code that would change.

Step	Change	Gap rows	Where	Effort
1	Add a daily trade cap and a daily loss lock (new settings, checked before buying in each scan)	34, 35, 36	`ScanCoordinator.cs`, `SettingDef.cs`, `appsettings.json`	S
2	Apply the existing stock-level downtrend test to each stock, not only NIFTY, behind a setting	6	`VwapStrategy.cs` (`Candidate`)	S
3	Performance scorecard: trades, win rate, average win/loss, realised R, expectancy, by day and week; keep a rolling multi-day history	38, 39, 41	`ScanCoordinator.cs`, `GridCsv.cs`, new page	M
4	Multi-day backtest harness using the same strategy and `ExitEvaluator` on Kite historical candles. Use it to test the reward-risk setting (1.5 vs 2) and Stop Reprieve on versus off.	26, 29, 40	new project file reusing `VwapState`, `ExitEvaluator`	M
5	Build 5-minute and 15-minute candles by aggregating the 1-minute candles already downloaded (no extra API calls), then add a higher-time-frame trend filter	10	`Scanner.cs`, `VwapStrategy.cs`	M
6	Add prior-day high/low, day high/low and simple swing levels. Use them for S/R-aware targets and stops, and as a filter ("room to next level at least 2x risk").	9, 11, 25, 26	new `Levels.cs`, `VwapStrategy.cs`, `ExitEvaluator.cs`	M
7	Second VWAP strategy: trend pullback (S1) and rejection (S2), including a short side in `Portfolio.cs` and `ExitEvaluator.cs`	3, 4, 7, 21	new strategy class, `Portfolio.cs`, `ExitEvaluator.cs`	L
8	Breakout + retest (S4) and false-breakout (S5) on the new levels	13, 14	new strategy class	M
9	EMA 9/21, RSI, and a small candlestick library (engulfing, hammer, morning/evening star, pin bar) as optional confirmations; optional confirmation-candle entry mode	15, 16, 18, 24	`VwapState`, new `Patterns.cs`	M
10	Partial booking at target 1 with a trailing runner	27, 28	`ExitEvaluator.cs`, `Portfolio.cs`	M

Step	Change	Gap rows	Where	Effort
11	SMC (sweep, CHoCH, order block, FVG), chart patterns, MACD	17, 19, 20	new modules	L, and the most subjective; do last and only if backtests justify it

8. Cautions

Point	Detail
Not advice	This is a comparison of educational material against a code base, not investment or trading advice.
No edge shown	The documents give no win rates or results, and say that no setup guarantees profit. Each strategy in section 3 needs backtesting on the app's own data before it influences a decision.
Mean reversion vs trend	S3 (the app) buys weakness below VWAP. The documents' VWAP examples are trend-following (S1, S2). The two can disagree on the same chart, so test them separately before combining.
Reading accuracy	The PDFs are images read visually. Figures were read from page images, so a misread of small print is possible; check any number you plan to hard-code against the page cited.
